ABSTRACT

The Water in Africa Project was realized over a 2-year period by a team of Peace Corps volunteers. As part of an expanded, detailed design, resources were collected from over 90 volunteers serving in African countries, photos and stories were prepared, and standards-based learning units were created for K-12 students. This unit, "Narrative vs. Expository Texts," contends that many students have difficulties determining the difference between narrative and expository texts. The unit uses vignettes written by Peace Corps volunteers to compare and contrast these types of texts. Intended for use with high school students, the unit can be used in English, reading, and geography classes. Five class periods of 45 minutes each are suggested. The unit lists materials needed, outlines applicable standards, provides essential questions, and gives student objectives. It details day-by-day procedures, assessment activities, and follow-up/enrichment activities. Appended are photographs of daily activities in Lesotho and Madagascar accompanied by expository text. (Contains evaluation sheets and graphic organizer handouts.) (BT)

Water in Africa is a project of Peace Corps World Wise Schools.

2000

Funded through a grant from the Department of Education, the Water in Africa project was realized over a two year period by a team of Peace Corps Volunteers, World Wise Schools' (WWS) classroom teachers, and WWS staff members. Inspired by an idea of one creative WWS teacher, the project eventually expanded into a detailed design. The development and implementation of the design included the collection of resources from over 90 Volunteers serving in African countries, the preparation of those photos and stories, and the creation of standards-based learning units for K-12 students.

Narrative vs. Expository Texts

Description:

Many students, especially students with limited English language skills, have difficulties determining the difference between narrative and expository texts. This unit will use vignettes written by Peace Corps Volunteers serving in Lesotho and Madagascar to compare and contrast these types of texts. As final products, students will write both a narrative essay and an expository essay. This unit was piloted with high school second language learners.

Timeframe: 5 class periods (45-minutes each)

Curricular Areas: English
Reading
Geography

Grade Level: High school, particularly with academically under-prepared or second language learners

Materials

- Internet access to the Water in Africa Web site
<http://www.peacecorps.gov/www/water/africa/>
- World map
- Student Readings of narrative and expository texts
- Graphic Organizer
- Evaluation Rubrics for Narrative and Expository Essays
- Supplemental pictures of Lesotho and Madagascar (optional)

Standards

Language Arts 1- Demonstrates competence in the general skills and strategies of the writing process

Benchmark-- Writes expository compositions (e.g., presents information that reflects knowledge about the topic of the report; organizes and presents information in a logical manner)

Writes narrative accounts

Language Arts 7- Demonstrates competence in the general skills and strategies for reading a variety of informational texts

Benchmark-- Differentiates between fact and opinion in informational texts

- Language Arts 10- Understands the nature and complexity of Earth's cultural mosaics
- Benchmark-- Understands how human characteristics make specific regions of the world distinctive

Essential Questions

How can looking at something from two perspectives affect my view of it?

How can I adapt my writing style to convey different information about a place?

Objectives

Students will:

- Know what a narrative text is, know what an expository text is, and be able to explain the difference between the two
- Be able to find sensory details in narrative texts that they can match to photographs;
- Be able to write a narrative and expository text of their own.

Procedure

Day One

1. Although the focus of the lesson is the difference between narrative and expository texts, begin with a brief overview of the countries of Madagascar and Lesotho. Locate the two countries on a map of Africa, comparing their physical features. For example, Lesotho is landlocked, whereas Madagascar is surrounded by ocean. This will help the students to have a schema for the texts which they will read. Also introduce the topic of water usage, a common theme in these texts.
2. Pass out the Lesotho narrative texts. Discuss narrative texts. Map out the characteristics of narrative texts on the board. For example, narratives describe personal experiences, use sensory details, and are told from a first person point of view.
3. Read the first narrative with the class, then discuss the content for comprehension. How is life in Lesotho different from life in the US? Do you have to wait in line for water? Do you have to carry it home? Are we having a dry year?
4. Read the text again, this time pausing to identify the characteristics of the text. For example, in the first sentence the narrator refers to "we," the first person point view, and later describes the sound of water flowing. Discuss the text with the students. What are its characteristics (for example, personal experience, first person point of view, sensory details)?
5. Hand out the sensory detail graphic organizer. As a class, have students write the

sensory details of the text under the correct heading. Discuss what senses the author describes. Does she cover all of five? Some more than others? Any not at all?

6. Homework: Have students read the second Lesotho narrative text and fill out its graphic organizer.

Procedure Day Two

1. Discuss the previous night's homework. Put the graphic organizer on the board or overhead projector and fill it in with the details that the students found during their readings. Discuss again the qualities of narrative text. Tell students to hold on to their graphic organizers for use during day three.
2. Hand out the Lesotho expository text. Discuss expository texts. Tell students that an expository text is written to inform, explain, describe, or persuade. The Lesotho text, for example, describes the geography of Lesotho. Talk about the characteristics of expository texts (written from a non-personal point of view, and generally lacking sensory details and a sense of storytelling). Read the text together as a class, pointing out its characteristics. For example, notice that the text is not written in the first person. The reader is presented with a description of Lesotho from a non-personal point of view. The text is broader, referring to the country in general, rather than a specific incident or anecdote.
3. Ask students to take out their graphic organizer. Allow them to work a few minutes trying to fit the expository text into the organizer. With the exception of a few visual details, it will be difficult to find the sensory details of the text, reinforcing the differences between the two text structures. Pass out the Madagascar texts without the identifying labels on top, and two copies of the graphic organizer. Have students work in pairs to identify which texts are the narrative and which are the expository. Students should fill out the graphic organizers for the narrative texts for homework.

Day Three

1. Using the Madagascar and Lesotho photos from the Water in Africa Web site (or the attached print-out of the photos), have students work in pairs to identify details from the texts that they see in the photos. Each student pair should choose at least two pictures that emphasize sensory details that they identified in the text. For example, if a student identified the visual detail of the "water cans waiting in line for the water," then they would choose a picture of the water cans or well, etc. Each group can choose photos of their choice, and write one sentence to justify why they chose each picture. At the end of class have groups share their photos and justifications with the rest of the class.
2. If the teacher wishes to limit the photo choices, the following are photos which correlate well with the texts: Lesotho: LE0113, LE0226, LE0230, LE0303, LE0309, LE0403, LE0502, LE0507, LE0702, LE0706, LE0711, Madagascar MG0111, MG0215, MG0231, MG0313, MG0634.

Day Four & Five

1. Pass out the rubric for writing narrative texts and discuss it with the class. Talk about each of the areas and review the qualities that make up a good narrative text. Ask students to write a narrative text of their own, describing a place that they know well. It can be their hometown, a park, their house, their room, or any other favorite place. Students should write to the rubric, making sure that their essays contain all the elements in the rubric. (This may take more than one day.)
2. Students do the same with the expository text, writing an essay about the same place as the narrative text, using the expository rubric

Assessment

Student essays are the end product, and should be assessed according to the rubrics that were discussed in class. Final assessment should be done by the teacher with the rubrics as a guide. The rubrics use a 25 point scale which can be modified by the teacher if so desired.

Follow-up/Enrichment Activities

The Water in Africa Web site contains excellent examples of narrative texts on countries other than Lesotho and Madagascar. The lesson could be modified using texts from countries to meet district or state standards. <http://www.peacecorps.gov/www/water/africa/>

About the Author

Carly Sporer Garrett was a Peace Corps Volunteer in Mongolia in 1995-96. She currently teaches English and Reading at Palomar High School in Chula Vista, CA. She tested this unit with her second language learning students and said: "I worked with narrative and expository texts with my students. They all really liked the Africa vignettes. Even though it wasn't the main point of the lesson, the students were talking about water usage--which I thought was very cool."

Narrative Texts

Lesotho

Right now we are having a very dry season. Every other day when the taps are expected to be turned on, I take my bucket to the tap at about 6:00AM and put it in line. Your bucket's place in line is very important because the water is on for a limited time and water might run out before all the buckets are filled. A person living near the tap will open it and when she hear the water starting to flow she will begin to fill the buckets in order. Word that the water is running travels quickly. The women and girls come for their buckets and carry them on their heads to their homes. In order to make sure my water will last, I use the same water to wash my hair, take a sponge bath, wash my underwear and clean the floor. Large laundry is taken to the river until it becomes too dry. I always set aside water for drinking and cooking. The school has its own water tap, but they too only get water every other day. On no water days a tub is set out for the students to rinse the eating containers they have brought from home. The school does cook the porridge.

*By Amy Bratsch
Ha Thamere-Qutin-Mt.Moorosi, Lesotho*

Most drinking water comes from one of three sources: a tap or pump, a natural spring, or collected rainwater. Except for the rainwater, the water has to be transported from the source to the people's houses. This is not an easy task. Water is heavy and people must walk 1-2 miles on rocky mountainous paths. Many villages have a water source within a 30-minute walk. Taps are the best. Just turn the handle and water pours! The pumps take more effort. Some are long levers that look like one-sided teeter-totters. Children will bounce them up and down with their whole bodies. Some are two handles that need to be turned like the pedals on a bicycle. And still others need to be cranked in circles horizontally.

But even taps or pumps are no guarantee of water. Sometimes the water only flows for a few hours a day-often early in the morning around 5:00 A.M. Villagers must wake up this early to get their buckets in line and wait for the water. Sometimes the taps dry completely and people must walk even further to another village or natural spring. (Remember how hard it is to carry water?) Natural springs are good but people need to scoop the water into buckets, which can take a long time. Rainwater is collected from most metal roofs, but the traditional houses have thatched roofs. And the dry season can last a long time, which makes collecting rainwater ineffective during that time.

My water comes from all of these sources. I need to pay someone to collect my water from a tap or spring, whichever is available. I can't do it myself. It is too far to carry those heavy buckets and I haven't mastered carrying them on my head! If it rains, my host family will collect rainwater from their metal roof. My house is next to theirs, but my roof is thatch.

Expository Text

Lesotho

Lesotho is a land of mountains, with two major ranges dissecting the country from NE to SW. It lies entirely out of the tropics, at the Northern Hemisphere equivalent of Houston, Texas. The climate of Lesotho is dry and sunny, with clearly marked seasons. Being in the Southern Hemisphere, the seasons are reversed from what we in the Northern Hemisphere are used to. The winter months from June to September vary from chilly to very cold, depending on what elevation you are at. Days are normally filled with sunshine and intensely blue skies. Mean winter temperature in Maseru is around 50 degrees Fahrenheit. It freezes almost every night in the mountains, and snow is common. Summer, from November to February is the rainy season, though earlier in this decade there were droughts and some wells and springs ran dry.

From : The Peace Corps Lesotho Volunteer Information Packet 1999

Madagascar

Namoly is situated in a valley in the mountains on the central high plateau of Madagascar. The water runs off of the surrounding mountains and enters the valley in the form of two rivers. There is always an abundant amount of water in the river. People use this water for all of their needs such as cooking, drinking, washing, clothes, watering gardens, and irrigating the fields. Almost everyday women or young girls can be seen fetching water from the river in brightly colored buckets. They balance full buckets of water on their head for the trip home. Never once do they spill the water, even though the majority of them have babies tied on to their backs with lambas. However, a few of the villages have water pumps, built by World Wildlife Fund, saving them the walk to the river. My water comes from one of these pumps, which I collect in the buckets every morning. Oftentimes I wait my turn with the other young girls fetching their water. The most interesting and beautiful aspect of water here is how much water is used for irrigation of the rice fields.

*By Mark Danenhauer
Namoly, Madagascar*

In Ambalahenko there are as many ways of cooking fish as there are for catching them. The people fish and gather food for a living. Living is working and work is living. At night people go by canoe with torches to hunt for octopus, lobster and fish. Methods of fishing are divided up among the genders and the female specific method is called "manitry." We must wait for the afternoon winds and low tide to push the schools of fish upon shore. We then walk the length of three sandy beaches to where the rocks begin. We wade through the blue, shallow water, thigh deep, forming a semi-circle in the water. When the lead woman spots sign of schooling fish (a slight disturbance on the surface of the water) we circle around and herd them into a cloth net. The event is a mix of shouting, splashing and excitement as the circle tightens. It's a time when all the women of the village work together and share what is caught.

*By Jina Sagar
Ambalahenko, Madagascar*

Madagascar

The Republic of Madagascar is made up of the island of Madagascar and, the fourth largest in the world, and several smaller islands off the southeastern coast of Africa in the Indian Ocean. Madagascar was once a part of France, and became an independent state in June 26, 1960. Madagascar is currently experiencing serious environmental problems, particularly in the areas of deforestation and soil erosion. Madagascar has a climate that is divided into rainy and dry seasons. In the summer (December to April), the coastal regions are very hot and dry in the west, and very hot and dry in the east. The central plateau is warm with periods of rain. The winter months on the central plateau do get very chilly, along the west coast it is warm and dry and along the east coast it is warm with occasional showers.

Madagascar Photographs

MG0535

This is the outflow point of Rip Rap dam on Lake Ravelobe near Ampijavoa, Madagascar. This picture was taken during the dry season when the lake is very low. The dam is used to control the irrigation of rice paddies of Marovoay.

by Robin Larson Paulin

Andranofasika, Madagascar (1999)

MG0536

The water from Lake Ravelobe is controlled by Rip Rap dam. Notice the high water mark halfway up the dam on the right. The water is very low because it is the end of the dry season.

MG0706

This sacred waterfall in Park National Andritra, Madagascar, is called Riambavy, or water fall of the woman. It is one source of water for people in the area.

by Mark Danenhauer
Namoly, Madagascar (1999)

MG0708

Men have dug this pit in Ambalavao, Madagascar to get water during the dry season. They must climb the ladder with buckets or lower them from the side. They will use the water on the fields during the dry season. During the wet season this is unnecessary.

The woman shown here is watering mulberry plants that will feed silk worms at a silk factory in Ambalavao, Madagascar.
